developing said central database by said central server based on said data according to said algorithm;

analyzing said data, said database, said central database, a part thereof, or a combination thereof, by said central server, said data communication apparatus, said data collection apparatus, or a combination thereof, according to said algorithm;

producing an individual report, said individual report being a single individual report or a plurality of individual reports, on said individual user, according to said algorithm;

producing a group report, said group report being a single group report or a plurality of group reports, on said group of individual users, or a sub-group of said group of individual users, according to said algorithm; and

improving and modifying said algorithm either manually by an administrator or automatically by said server, according to said algorithm, based on information associated with said data, said database, said central database, a part thereof, or a combination thereof.

64. The data collection method of claim **63**, wherein said data collection apparatus comprises at least

a power source apparatus, said power source apparatus capable of providing power to said data collection apparatus;

a timing apparatus, said timing apparatus capable of providing date and time information to said data collection apparatus;

a data collecting apparatus, said data collecting apparatus capable of continuously or periodically collecting said data associated with said individual user, according to said algorithm;

a data processing apparatus, said data processing apparatus capable of administrating said data collection apparatus and processing said data collected by said data collecting apparatus, according to said algorithm;

a data storing apparatus, said data storing apparatus capable of storing said data for a period of time, according to said algorithm; and

a data communicating apparatus, said data communicating apparatus capable of communicating said data to said central server through said telecommunication apparatus, according to said algorithm.

65. The data collection method of claim **63**, wherein said individual report, used and analyzed in association with said data, from said database, said central database, or a combination thereof, can be used to determine past condition, and predict future condition, of said individual user, according to said algorithm.

66. The data collection method of claim **63**, wherein said group report, used and analyzed in association with said data, from said database, said central database, or a combination thereof, can be used to determine past condition, and predict future condition, of said group of users, or a sub-group of said group of users, according to said algorithm.

67. A data collection network capable of collecting data from a group of users, said data collecting network comprising:

means and computer means for providing a central server, said central server being an independent server or a plurality of decentralized servers connected through internet;

means and computer means for registering a group of users to said central server;

means and computer means for registering a data collection apparatus to each of individual user of said group of users and said central server;

means and computer means for registering a closed container associated with each of said data collection apparatus to said central server, said closed container containing a medium, said data collection apparatus disposed within said medium;

means and computer means for registering a telecommunication apparatus associated with each of said data collection apparatus to said central server, said telecommunication apparatus wirelessly coupling said data collection apparatus to said central server and capable of communicating with said central server;

means and computer means for establishing a database associated with each of said data collection apparatus, said database containing said data collected by said data collection apparatus and communicated to said central server, said database being administrated by said central server according to an algorithm;

means and computer means for establishing a central database, said central database being developed from said data and said database, and administrated by said central server according to said algorithm;

means and computer means for collecting said data by said data collection apparatus from said individual user through said medium either continuously or periodically, said data describing and representing impact of said individual user with said closed container, according to said algorithm;

means and computer means for processing said data by said data collection apparatus according to said algorithm;

means and computer means for communicating said data by said data collection apparatus to said central server through said telecommunication apparatus according to said algorithm;

means and computer means for developing said database by said central server based on said data according to said algorithm;

means and computer means for developing said central database by said central server based on said data according to said algorithm;

means and computer means for analyzing said data, said database, said central database, a part thereof, or a combination thereof, by said central server, said data communication apparatus, said data collection apparatus, or a combination thereof, according to said algorithm;

means and computer means for producing an individual report, said individual report being a single individual report or a plurality of individual reports, on said individual user, according to said algorithm;

means and computer means for producing a group report, said group report being a single group report or a plurality of group reports, on said group of individual users, or a sub-group of said group of individual users, according to said algorithm; and

means and computer means for improving and modifying said algorithm either manually by an administrator or automatically by said server, according to said algorithm, based on information associated with said data, said database, said central database, a part thereof, or a combination thereof.
